

Abstract

The present invention provides a system for dynamically translating between a first communication protocol and a second communication protocol, said system
5 comprising: means for receiving a first communication signal utilizing said first communication protocol; means for determining said first communication protocol; means for initiating a first communication protocol translator to extract data from said first communication signal in accordance with said first communication protocol and for storing said data in a buffer; and means for retrieving said data from said buffer
10 and translating into a second communication stream utilizing said second protocol.
